批量处理数据的代码，2020年10月21日

In [12]:

```
# 导入必要的包
import os
import numpy as np
import pandas as pd
import datetime
```

In [11]:

```
# 自己练习
def file_name(file_dir):
    for root, dirs, files in os.walk(file_dir):
        print(root)
        print(dirs)     # root下的子目录
        print(files)    # root下的文件
        print('\n\n')

# 测试
file_name("./expData_201909/20190911")
```

```
./expData_201909/20190911
['exp_02', 'xxx_01']
['exp_20190911_0.txt', 'exp_20190911_1.txt', 'exp_20190911_2.txt', 'exp_20191017_
1.txt', '测试数据行数是否为801.xlsx']

./expData_201909/20190911\exp_02
['CG', 'EXP']
['exp_20190911_6.txt', 'exp_20190911_7.txt', 'exp_20190911_8.txt', 'exp_20191017_
1.txt']

./expData_201909/20190911\exp_02\CG
[]
['exp_20191017_1.txt']

./expData_201909/20190911\exp_02\EXP
[]
['exp_20190911_6.txt', 'exp_20190911_7.txt', 'exp_20190911_8.txt']

./expData_201909/20190911\xxx_01
[]
['exp_20190911_3.txt', 'exp_20190911_4.txt', 'exp_20190911_5.txt']
```

我感觉os.walk()会读取根目录下的子目录，子目录下的子子目录，递归地执行下去，直到搜索到全部的文件夹！

In [12]:

```
# 测试
path = "./expData_201909/20190911"
files = os.listdir(path)
# 查看
type(files), len(files)
```

Out[12]:

```
(list, 7)
```

In [13]:

```
files
```

Out[13]:

```
['exp_02',
 'exp_20190911_0.txt',
 'exp_20190911_1.txt',
 'exp_20190911_2.txt',
 'exp_20191017_1.txt',
 'xxx_01',
 '测试数据行数是否为801.xlsx']
```

函数os.listdir(path)会返回一个列表，里面是path目录下的文件夹和文件的文件名

下面是一个比较好用的函数

In [14]:

```
import os

def file_name(file_dir):
    L=[]
    for root, dirs, files in os.walk(file_dir):
        for file in files:
            if os.path.splitext(file)[1] == '.txt':
                L.append(os.path.join(root, file))
    return L
```

In [15]:

```
# 测试
mylist = file_name(path)
# 查看
type(mylist), len(mylist)
```

Out[15]:

```
(list, 15)
```

In [16]:

```
mylist
```

Out[16]:

```
['./expData_201909/20190911\\exp_20190911_0.txt',
 './expData_201909/20190911\\exp_20190911_1.txt',
 './expData_201909/20190911\\exp_20190911_2.txt',
 './expData_201909/20190911\\exp_20191017_1.txt',
 './expData_201909/20190911\\exp_02\\exp_20190911_6.txt',
 './expData_201909/20190911\\exp_02\\exp_20190911_7.txt',
 './expData_201909/20190911\\exp_02\\exp_20190911_8.txt',
 './expData_201909/20190911\\exp_02\\exp_20191017_1.txt',
 './expData_201909/20190911\\exp_02\\CG\\exp_20191017_1.txt',
 './expData_201909/20190911\\exp_02\\EXP\\exp_20190911_6.txt',
 './expData_201909/20190911\\exp_02\\EXP\\exp_20190911_7.txt',
 './expData_201909/20190911\\exp_02\\EXP\\exp_20190911_8.txt',
 './expData_201909/20190911\\xxx_01\\exp_20190911_3.txt',
 './expData_201909/20190911\\xxx_01\\exp_20190911_4.txt',
 './expData_201909/20190911\\xxx_01\\exp_20190911_5.txt']
```

上面自定义的函数 file_name(path)会返回path目录下全部.txt文件的文件名，放在一个list当中

In [17]:

```
# 获取子目录，到CG和EXP子目录
def subdir_name(file_dir):
    L1=[]
    for root, dirs, files in os.walk(file_dir):
        for subdir in dirs:
            # step1.获取一级目录
            curdir = os.path.join(root, subdir)
            # step2.进入一级目录，添加二级目录
            for subroot, subdirs, subfiles in os.walk(curdir):
                for subsubdir in subdirs:
                    L1.append(os.path.join(subroot, subsubdir))
    return L1
```

In [18]:

```
# 测试
path = "./expData_201909/20190912"
mylist3 = subdir_name(path)
mylist3
```

Out[18]:

```
['./expData_201909/20190912\\exp_01\\CG',
 './expData_201909/20190912\\exp_01\\EXP',
 './expData_201909/20190912\\exp_02\\CG',
 './expData_201909/20190912\\exp_02\\EXP',
 './expData_201909/20190912\\exp_03\\CG',
 './expData_201909/20190912\\exp_03\\EXP',
 './expData_201909/20190912\\exp_04\\CG',
 './expData_201909/20190912\\exp_04\\EXP']
```

OK!我的想法是先计算出参考数据，后面再搞批量处理的部分

In [19]:

```
# 样品盒参考数据
path = 'G:/202006-202008_rice_experiment/database_info_txt_files_withid-Backup/20200723-sample_holder'
```

In [20]:

```
os.listdir(path)
```

Out[20]:

```
['1-1', '2-1', '3-1', '4-1', '5-1', '6-1']
```

In [24]:

```
# 自己测试
file_list = []
for subdir in os.listdir(path):
    # print(subdir)
    subdir_path = os.path.join(path, subdir)  # 组合成绝对路径
    print(subdir_path)
#     for file in os.listdir(subdir_path):
#         file_list.append(os.path.join(subdir_path, file))

# 查看
# file_list
```

```
G:/202006-202008_rice_experiment/database_info_txt_files_withid-Backup/20200723-sample_holder\1-1
G:/202006-202008_rice_experiment/database_info_txt_files_withid-Backup/20200723-sample_holder\2-1

#### 那么，批量处理数据的代码就基本完成了！！  2020年11月5日
#### 但是批量处理的结果又对不对呢？ 怎么验证？
#### 另外，VNA的数据的批量处理呢，明天继续搞VNA数据的批量处理
```

In [ ]:

```
#### 2020年11月6日，继续VNA数据的批量处理
```

1.先处理VNA参考数据

In [17]:

```
# 我目前的想法是写一个函数，专门用于处理 VNA采集的csv文件，只需要输入csv文件的路径就可以得到 ndarray类型的数据

def getData_csv(filepath):
    '''
    输入：VNA采集的csv文件的路径
    输出：中间一列的数据，类型：ndarray
    作者：张津阳
    日期：2020年10月10日
    '''

    # step 1.加载原数据
    df = pd.read_csv(filepath
                     ,header=None
                     ,delimiter='\t'
                    )
    # step 2.去掉前3行
    df_drop = df.drop([0, 1, 2], axis=0)

    # step 3.拆分dataframe
    df_drop_split = df_drop[0].str.split(',', expand=True)

    # step 4.修改列名
    df_drop_split.columns = ['Frequency', 'Formatted Data', 'Formatted Data.1']

    # step 5.修改行索引 index
    df_drop_split.index = range(len(df_drop_split))

    # step 6.使用df.astype()强制类型转换
    df_drop_split['Formatted Data'] = df_drop_split['Formatted Data'].astype('float')

    # step 7.获取其中的有效数据，也就是中间一列
    data = df_drop_split['Formatted Data'].values

    return data
```

In [18]:

```
# 目前的思路，要写一个自定义函数，处理某一厚度下的csv数据
def VNA_refData_singleThickness(path):

```
# 改进之处：
# 1.列名中缺了  含水率 + '_' + 厚度 + 样品编号
# 2.是不是应该把批量处理数据的代码，我主要指的是自定义函数，单独整理出来，否则看着太乱！
# 3.为了后续的建模，是不是需要把厚度、和含水率数据也加入到csv文件中？
```

到此，数据的批量处理就告一段落了！

2020年11月8日，把数据整理成后续建模的格式

In [2]:

```

```

Out[6]:

```
dtype('float64')
```

将上面的循环整理成一个自定义函数

In [15]:

```
def get_average_spectrum_from_OM2S2(path_A, path_mc, path_thickness, parent_path, save_csv=Fals
e, data_type='Attenuation'):
    '''
    日期：2020年11月9日
    功能：将衰减数据表EXP_A.csv中，每种厚度的5次样品重复数据取平均，得到平均频谱数据，用于绘频谱
图，和进一步分析
    作者：张津阳
    重写：2020年11月14日
    原因：想把函数的功能扩展到能处理 A or Phi 的数据
    '''
    ## 衰减数据（当然，后面会扩展到不只针对衰减数据、而且可以处理相移数据 Phi）
    df_A = pd.read_csv(path_A, index_col='freq')   # shape: 801 × 450
    ## 含水率数据
    df_mc = pd.read_excel(path_mc, index_col='mark')
    ## 厚度数据
    df_thickness = pd.read_excel(path_thickness, index_col='mark')

    ## 定义装 平均频谱数据 的“容器”
    arr_freq = np.around(np.arange(2.00, 10.01, 0.01), decimals=2)
    df_A_mean = pd.DataFrame(arr_freq, columns=['freq'])           # numpy -> dataframe，同时指
定列名！

    flag = 1  # 用作计数标记

    for j in range(len(df_mc.index)):

        mc_mark = df_mc.index[j] + '_'      # 获取含水率标签（同时也是行索引，如 MC-11.39、MC-20-
2、MC-30-1）

        for k in range(len(df_thickness.index)):

            thickness_mark = df_thickness.index[k]  # 获取厚度标签（如 1cm、2cm）

            mark = mc_mark + thickness_mark         # 组合出 “含水率_厚度”，如 MC-11.39_1cm

            number = sum(map(lambda x : mark in x , df_A.columns))  # 理论上，每次循环中的numbe
r应该都为5

            if number == 5:
                print(flag, '成功发现5条待求平均的频谱！')
                flag += 1    # 计数增加
            else:
                print(mark, ' ,该标识对应的频谱不是5条，请检查！')
                return

            # ****************** 计算平均频谱数据 *****************

            first_column = mark + '-1'

            if first_column in df_A.columns:

                # print(df_A[first_column].index)  # 测试语句，结果：Float64Index([ 2.0, 2.01,
 2.02,..., 9.99, 10.0], dtype='float64', name='freq', length=801)

```
### 继续下一个自定义函数，抽取VNA的平均频谱中的数据，组成待绘图分析的频谱数据！

### 等等，我自己好好想一下，我是不是已经把VNA获取的平均频谱 处理成 与OM2S2获取的平均频谱 具有相同的格式了（列名一致）
### 好像确实，列名都一致了，那么是不是不需要再单独去自定义函数来提取频谱数据了呢，直接用11月12日定义过的函数就行了吧！
### 那么，我下面就来试下！
#
#
#

## 使用VNA平均频谱数据，如：VNA_df_A_mean_yyyy-mm-dd.csv
#----------------------------    输入参数   -------------------------
path = 'G:/202006-202008_rice_experiment/20201108_data_summary/VNA_df_A_mean_2020-11-13.csv' #使用VNA数据生成的平均频谱数据
parent_path = 'G:/202006-202008_rice_experiment/20201108_data_summary'
mc_mark_list = ['MC-10', 'MC-11.39', 'MC-13', 'MC-15', 'MC-18', 'MC-20', 'MC-23', 'MC-25', 'MC-28-1', 'MC-30-1']
path_mc = 'G:/202006-202008_rice_experiment/20201108_data_summary/moisture_content.xlsx'
#---------------------------- 调用自定义函数 -------------------------
VNA_df_spectrum = get_spectrum_data(path, mc_mark_list, parent_path, path_mc, '3cm', True, 'VNA')
#---------------------------- 查看 ---------------------------------
VNA_df_spectrum.shape
```

```
当前处理的数据类型： VNA
MC-10_3cm
MC-11.39_3cm
MC-13_3cm
MC-15_3cm
MC-18_3cm
MC-20_3cm
MC-23_3cm
MC-25_3cm
MC-28-1_3cm
MC-30-1_3cm
提取： MC-10_3cm
提取： MC-11.39_3cm
提取： MC-13_3cm
提取： MC-15_3cm
提取： MC-18_3cm
提取： MC-20_3cm
提取： MC-23_3cm
提取： MC-25_3cm
提取： MC-28-1_3cm
提取： MC-30-1_3cm
df_spectrum.shape:  (801, 11)
File save done!
run over!
```
